Work Requested

The freezer has been alarming all weekend not temping properly

Equipment Name: 13 Door Freezer 3

Model:

Manufacturer:

Serial Number:

Work Performed

Drove to site then had Lisa show me which section of freezers were warm. All freezer cases were below -20°C and the alarms had went away. Checked case airflow and found that the system 3 had low airflow. Checked defrost circuit and found that there were two fuses blown. Checked case history and found that we had this problem back in January and therefore should replace the heaters so they don't keep blowing the fuses.

I have submitted a recommend repair to our estimating team and have followed up with them so the quote could be rushed out.

Drove to site and had Lisa show me which sections of the freezer were warm. All freezer cases were below -20°C and alarms were no longer present. Checked case airflow and found that system 3 had lower airflow than the rest.

Checked defrost circuit and found the fuses had blown. I checked the case history and found that this has been an ongoing issue and therefore we should replace the defrost heaters. Submitted quote info to our estimating department and asked the quote to be rushed out.
